-- SUBGELLULAR LOCATION: Type I membrane protein.
-- TISSUE SPECIFICITY: Selectively expressed in lymphoid tissues.
Most highly expressed in thymus and spleen.
-- SIMILARITY: Belongs to the type I cytokine family of receptors.

Most highly expressed in thymus and spleen.
SIMILARITY: Belongs to the type I cytokine family of receptors.
Subfamily 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N-LINKED (GLCNAC. . .) (POTENTIAL).

                                                                                                                                                                                                                                                                                                                                                        MEDITE=90171145; PubMed=2404337; Itoh N., Yonehara S., Schreurs J., Gorman D.M., Maruyama K., Ishii A., Yahara I., Arail K., Miyajima A.; "Cloning of an interleukin-3 receptor gene: a member of a distinct receptor gene family."; Science 247:324-327(1990).

-I. FUNCTION: In mouse, there are two classes of high-affinity IL3 receptors. One contains this IL3-specific beta chain and the other contains the beta chain also shared by high-affinity IL5 and GM-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        63 HMDVFHFMADDIFSVNITDQSGNYSQECGSFLLA-ESIKPAPPFNVTVTFSGQYNISWRS

SUBUNIT: Heterodimer of an alpha and a beta chain.
SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                 Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

"Cloning and expression of a gene encoding an interleukin 3 receptor—
It like protein: identification of another member of the cytokine
receptor gene family."; Proc. Natl. Acad. Sci. U.S.A. 87:5459-5463(1990).
C. - FUNCTION: High affinity receptor for interleukin-5
and granulocyte-macrophage colony-stimulating factor.
C. - SUBGELLULAR LOCATION: Type I membrane protein.
C. - SUBGELLULAR LOCATION: Type I membrane protein.
C. - SUBGELLULAR LOCATION: Type I membrane protein.
C. - SUMILARITY: Belongs to the type I cytokine family of receptors.
Subfamily 4.
C. - SIMILARITY: Contains 2 fibronectin type III domains.

"Novel B219/OB receptor isoforms: possible role of leptin in hematopoiesis and reproduction.";
Nat. Med. 2:585-589(1996).

```
1. ENORTION: Receptor for obseity factor (leptin). Involved in the regulation of fat metabolism and in a hematopoietic pathway regulation of fat metabolism and in a hematopoietic pathway regulation for normal lymphopoiesis. May play a role in reproduction.

-I FUNCTION: The short form (isoform A) may act to transport leptin to the cerebrospinal fluid. The putative soluble receptor (isoform E) could function as a transport protein.

-I SUBSELLULAR LOCATION: Type I membrane protein. Except for form E which could be secreted.

TISSUE SPECIFICITY: Isoform A: highest level of expression in lung and kidney, also present in kidney, heart, brain, spleen, liver, muscle, choroid plexus end hypothalamus. Isoform B: highest level of expression in hypothalamus and lower level in brain, testes and adipose tissue. Isoform E: expressed in adipose tissue, heart, and testes.

PTM: Phosphorylated on two tyrosine residues. Tyr-985 may be the major site of phosphorylation. Phosphorylation on both sites is required for full activity.
                                                                                             Subfamily 2.
-!- SIMILARITY: Contains 3 fibronectin type III domains.
-!- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                      JOINED.

Genet. 23:373-373 (1999).

-!- FUNCTION: Receptor for thrombopoietin. May represent a regulatory molecule specific for TPO-R-dependent immune responses.

-!- SUBCELLUIAR LOCATION: Type I membrane protein.

-!- ALTERNATIVE PRODUCTS:

FUNCTION: The short form (isoform A) may act to transport to the cerebrospinal fluid. The putative soluble receptor S) could function as a transport protein.

SUBCELLUAR LOCATION: Type I membrane protein. Except for which could be secreted.

-!- FUNCTION: Receptor for obesity factor (leptin). Involved in the regulation of fat metabolism and in a hematopoietic pathway required for normal lymphopoiesis. May play a role in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      STATS.

PTW: Phosphorylated on two tyrosine residues. Tyr-986 may be the PTW: Phosphorylation. Phosphorylation on both sites is required for full activity (By similarity).

SIMILARITY: Belongs to the type I cytokine family of receptors. Subfamily 2.

SIMILARITY: Contains 3 fibronectin type III domains.

SIMILARITY: Contains 1 immunoglobulin-like domain.

-!- FUNCTION: The short form (isoform A) may act to transport leptin to the cerebrospinal fluid (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein. Except for form B which could be soluble.
                                                                                                                                                                                                                                                                                                           VARIANTS ARG-109; ARG-223; ASN-656 AND THR-675.

In adults highest expression in heart, liver, small intestine, prostate and ovary. Low level in lung and kidney. Isoform B is highly expressed in hypothalamus.

DOMAIN: The cytoplasmic domain may be essential for intracellular signal transduction by activation of JAK tyrosine kinase and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PTM: Phosphorylated on two tyrosine residues. Tyr-984 may be the major site of phosphorylation. Phosphorylation on both sites is required for full activity (By similarity).

SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             in the

- I-TUNCTION: Receptor for interleukin 2. This beta subunit is involved in receptor mediated endocytosis and transduces the mitogenic signals of IL2.
- GUBUNIT: Noncovalent dimer of an alpha and a beta chains. IL2R exists in 3 different forms: a high affinity dimer, an intermediate affinity monomer (beta chain), and a low affinity forms also associate with a gamma chain.
- SUBCELLULAR LOCATION: Type I membrane protein.

STATS.

PTM: Phosphorylated on two tyrosine residues. Tyr-986 may be the major site of phosphorylation. Phosphorylation on both sites is required for full activity (By similarity).

SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (POTENTIAL)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2,

Novel soluble receptor polypeptides and polynucleotides used as cytokine antagonist for stimulating ligand activity-induced proliferation of hematopoietic cells and for suppressing immune response in a mammal.

Claim 27; Page 176-178; 243pp; English:

The invention relates to an isolated soluble zalphall cytokine receptor polypeptide and their cDNA molecules. Zalpha proteins are useful for inhibiting or antagonising the ligand activity-induced proliferation of haematopotetic cells man haematopotetic cells progenitors preferably lymphoid cells which are natural killer cells or cytotoxic T cells. Zalpha is useful for treating immume and inflammatory disorders, for reducing proliferation of neoplastic B.or T cells, for suppressing an

                                                                           for
                                                                                                                                                                                                                                                             The present sequence is the HUMAN Orphan Cytokine Receptor-10 (OCR10) polypeptide. HUMAN OCR10 gene is located on chromosome 16pl2. It is expressed at high levels in spleen, thymus, peripheral blood leucocytes and lymph nodes and moderately in heart and placenta. It has a role in immune system and cytokine function. It is useful in screening for cognate ligands or drugs that mediate survival and differentiation of cells expressing this receptor. Modified HUMAN OCR10 or its agonist can be used in the treatment of endocrine or immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20 CPDLVCYTDYLQTVICILEMWNLHPSTLTLTWQDQYEELKDEATSCSLHRSAHNATHATY

biological activity of the MU-1 hematopoietin receptor superfamily chain.

It,is used to screen for specific binding agents; to raise specific antibodies; as assay reagants, tissue markers etc. and therappeutically optionally expressed from the MU-1 gene by gene therapy). Many possible activities/uses of the MU-1 protein are described without supporting evidence, e.g. they regulate cell proliferation and differentiation, induce production of cytokines, simulate or suppress an immune response (e.g. for treating immune deficiency of any etiology, cancer or autoimmune disease, and for preventing transplant rejection) and response to hematopoiesis, e.g. for treating anemia. The MU-1 gene is used as a research reagent, for recombinant production of the protein, as tissue or molecular weight marker, for gene mapping; for production of anti-DNA or anti-protein antibodies etc. The MU-1 protein and the nucleic acids are also useful as nutritional supplements or sources and the antibodies can be used therapeutically, as assay reagents and for affinity purification

The present sequence represents a human zalphall ligand polypeptide, which is a cytokine. The zalphall ligand is useful for stimulating the proliferation and development of haematopoletric cells in vitro and in vivo. Zalphall ligand polymucleotides can be used as primers or probes for cloning the zalphall ligand-saporin fusion toxin may be used for treating leukaemias and lymphomas. Antagonists against calphall ligand are useful as research reagents for characterizing ligand-receptor interaction. Antagonists are also useful for inhibiting expansion, proliferation, activation and differentiation of cells involved in regularing hematopolesis. The zalphall ligand may also be used to stimulate an immune response against B cell tumour, a virus, a parasite or a bacterium. The zalphall polypeptides, polymucleotides, antagonists, agonists and antiboddes are also useful for the detection, diagnosis, prevention, and treatment of diseases associated with a zalphall ligand

                                                                                                                                                                                                                                                                                                                                                                                                                           79
                             New HUMAN orphan cytokine receptors 10 and 10-A useful for screening for drugs e.g. receptor agonists that may mediate survival and differentiation in cells naturally expressing the receptor and for
                                                                                                                                       The present sequence is that of HUMAN Orphan Cytokine Receptor 10-A (OCR10-A) polypeptide. It is expressed at high levels in spleen, thymus, peripheral blood leucocytes and lymph ndes and moderately in heart and placenta. It has a role in immune system and cytokine function. It is useful in screening for cognate ligands or drugs that mediate survival and differentiation of cells expressing this receptor. Modified HUMAN OCR10-A or its agonist can be used in the treatment of endocrine or immune disorders

                                                     This sequence represents a novel haemopoietin receptor protein family NR8, designated NR8gamma. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders
                                                                                                                                                                                                                        6

The present sequence is that of zalphall, a novel human class I cytokine receptor that may be involved in an apoptotic cellular pathway, or is a cell-cell signalling molecule, growth factor receptor, or extracellular cells. Signalling molecule, growth factor hormone activity. The sequence was deduced from a cDNA clone (see AAZ94533) isolated from a sequence was deduced from a cDNA clone (see AAZ94533) isolated from a cord library. Polypeptides comprishing amino acids 20-237, 20-255, 25-538, 20-538 and 1-538 of the present sequence are claimed. Zaphall cord library. Phen bush is supplement in the Raji cell line (ATC CCL 86) derived from Burkitt's lymphona. Zalphall polypeptides, and fusion cordinate the marks is also abundant in the Raji cell line (ATC CCL 86) derived from Burkitt's lymphona. Zalphall polypeptides, and fusion cordinates including them, can be obtained by expression in recombinant consecuence in the are used; to detect ligands and falso ligand agonists and antagonists) that stimulate proliferation and/or development of areplacement for serum in culture media; in vitro or in vivo, e.g. as a replacement for serum in culture media; in vitro or in vivo, e.g. as cortivity (direct antagonists) and for purification of cognate ligands activity of vaccines, suppressing tumours, treating leukopenia and crivity of vaccines, suppressing tumours, treating leukopenia and improving T-cell regeneration after bone marrow transplant rejection and to treat T-cell leukemia or lymphoma or prevent transplant rejection and to treat T-cell leukemia or lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TCHMDVFHFMADDIPSVNITDQSGNYSQECGSFLLARSIKPAPPFNVTVTFSGQYNISWR 120

Interleukin-9; IL-9; IL-2 receptor; 16445 protein; inflammatory; T-lymphocyte-related disorder; antiarthritic; antipsoriatic; human; immunosuppressive; antiasthmatic; antiallergic; antithyroid; cytostatic; antidiarrheic; nephrotropic; gene therapy. el interleukin-9/interleukin-2 receptor-like polypeptides useful for gnosis and treatment immune, inflammatory and respiratory disorders in screening assays for identifying modulators. Human IL-9/IL-2 receptor-like 16445 protein. 1. .19 /note= "signal peptide" "mature protein" Claim 8; Page 104-106; 119pp; English Location/Qualifiers Ą. protein; 538 18-MAY-2000; 2000WO-US013687 99US-00313913 (MILL-) MILLENNIUM PHARM INC (first entry) .538 /note= 2001-016209/02. standard; N-PSDB; AAC84147. 40200069880-A1 18-MAY-1999; 19-MAR-2001 Homo sapiens 23-NOV-2000 diagnosis AAB48001; Hodge MR; Peptide Protein Novel

The invention relates to isolated human and murine interleukin-9 (IL-9) (IL-2 receptor-like polypeptides. The plasmid containing the encoding CDMA insert is deposited as ATCC PTA-350. The IL-9/IL-2 receptor-like polypeptides (16445 proteins) can be recombinantly produced using standard recombinant methodology. The 16445 proteins are used for identifying their modulators and for diagnosis and treatment of immune, inflammatory and respiratory disorders and disorders associated with lungs, colon, kidney and lymphoid tissues including atopic conditions particular T-lymphocyte-related disorders including atopic conditions such as asthma, allergy, rheumatoid arthritis, psoriasis, chronic inflammatory diseases and graft verses host disease, disorders involving the colon such as diarrhoea, dysentery, infectious entercolitis, kidney disorders including polycystic kidney disease, cystic renal dysplasia, carcinoids. The 16445 polypeptides are also useful as modulating agents in cellular processes including growth promoting activity, particularly che detection of IL-9/IL-2 receptor-like encoding nucleic acid is useful as primers or hybridization probes for the detection of IL-9/IL-2 receptor-like encoding nucleic acids and for tissue typing and in forensic biology. The present sequence represents the human IL-9/IL-2 receptor-like polypeptide (AAH16445)

Sequence 538 AA;

The invention relates to isolated interleukin (IL)-9/IL-2 receptor-like polypeptide, 16445. The 16445 polypeptides can be expressed by standard recombinant methodology. The 16445 polypeptides can be expressed by standard recombinant methodology. The 16445 polypeptides can be expressed by standard recombinant methodology. The 16445 polypeptides particularly for the treatment of immune and respiratory disorders, particularly for the treatment of immune and respiratory disorders, including allergic conditions, such as asthma and allergy, including allergic rhinitis, psoriasis, the effects of pathogen infection, chronic inflammatory disease. Organ sepecific autoimmunity, graft rejection, and graft versus host disease. The molecules are also useful as modularing agence in a variety of callular processes including growth promoting activity, particularly the antigen contain haemopoletic progenitors, inman T cells, because inflammatory, and thymnic lymphomas and neuronal cell lines. They are useful for the modulation, diagnosis, and treatment of immune, inflammatory, and respiratory disorders and disorders associated with lungs, colon, kidney, and lymphoid tissues including tonsil and thymnic The present sequence

invention may exhibit cytokine, cell proliferation or cell
differentiation activity and may also exhibit immune stimulating or
immune suppressing activity and can be useful in the treatment of various
immune deficiencies and disorders including severe combined
immune deficiencies and disorders including severe combined
immunodeficiency (SCID). Another use of the invention is treating
autoimmune disorders such as connective tissue disease, multiple
culcimmune disorders use eythematcosus, recumatoid archritis,
clerosis, systemic lupus erythematcosus, recumatoid archritis,
clabees mellitus, and autoimmune inflammatory eye disease. The invention
is useful for the treatment of myeloid or lymphoid cell deficiencies and
in treating various anaemias or for use in conjunction with
is useful for the treatment of myeloid or lymphoid cell deficiencies and
in treating various anaemias or for use in conjunction with
precursors and/or erythroid cells. The polynucleotides and proteins can
also be used as nutritional sources or supplements. The present protein
captuence represents the human MU-1 haemopoietin receptor superfamily
chain. MU-1 is also a member of the cytokine receptor family. This
sequence was used in the invention for the characterisation of previously
unknown members of the haematopoietin receptor superfamily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SDYEDPAFYMLKGKLÓYELGYRNRGDPWAVSPRRKLISVDSRSVSLLPLEFRKDSSYELG 199
                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated soluble zalphall cytokine receptor polypeptide and their CDNA molecules. Zalpha proteins are useful for inhibiting or antagonising the ligand activity-induced proliferation of haematopoietic cells and haematopoietic cells progenitors preferably lymphoid cells which are natural killer cells or cytocoxic T cells. Salpha is useful for treating immune and inflammatory disorders, for reducing proliferation of neoplastic B or T cells, for suppressing an immune response in a mammal exposed to an antigen or pathogen. Zalpha is useful for treating diseases that require immune regulation including autoimmune diseases such as rheumatoid arthitis, multiple sclerosis, myasthenia gravis, systemic lupus erythematosus (SLB) and diabetes; sepsis, viral infection (dengue virus infection) and cancer. The present sequence is human soluble Zalphall cytokine receptor protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             79
                                                                                                                                                                                                                                                                                                                                         Novel soluble receptor polypeptides and polynucleotides used as cytokine antagonist for stimulating ligand activity-induced proliferation of hematopoietic cells and for suppressing immune response in a mammal.

The present invention relates to the isolation of a novel cytokine, zalphall Ligand and the polymucleotide encoding it. The invention also gives the sequence for the zalphall receptor and the polymucleotide encoding it. The zalphall Ligand polypeptide stimulates proliferation of encoding it. The zalphall Ligand polypeptide stimulates proliferation of natural killer (NR) cells or NR cell progenitors, the activation of NR cells, proliferation of B-cells stimulated with anti-Ch40 antibodies, stimulates an antigenic response in a mammal, and reduces proliferation of B-cells stimulated with anti-IgM antibodies. The zalphall Ligand polymucleotides can bind to zalphall Ligand epitopes. The zalphall Ligand polymucleotides can can in gene therapy. Zalphall Ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence represents human zalphall receptor polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TCHMDVFHFMADDIFSVNITDQSGNYSQECGSFLLAESIKPAPPFNVTVTFSGQYNISWR 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 SDYEDPAFYMLKGKLQYELQYRNRGDPWAVSPRRKLISVDSRSVSLLPLEFRKDSSYELQ 180

The invention relates to a novel method for treating or preventing an arthritic disorder in a subject. The method involves administering to the subject an interleukin-21 (IL-21)/IL-21 receptor (IL-21R) antergentiate optionally in combination with another therapeutic agent, to inhibit or reduce immune cell activity in the subject. The method is also useful for treating or preventing cancer or an infectious disorder, in a subject, by administering IL-21/IL-21R agonist, to increase immune cell activity. The method of the invention has antirheumatic, antiarthritic, osteopathic, antibociatic, cytostatic, antibacterial, virtucide, antipacatabile, antibociatic, antisathmatic, antiallergic, antianaemic, hepatotropic, antiuloer, antiallergic, antianaemic, hepatotropic, antibulity and antihinflammatory activity. The method is useful for treating or preventing an arthritic disorder such as rheumatoid arthritis, osteoarthritis, psoriatic arthritis, juvenile rheumatoid arthritis, and also cancer such as solid arthritis, antiple or antiple or antiple or metastatic lesion, or an infectious and answer and also cancer such as solid antiple of sorder such a bacterial, viral or parasitic infection in a mammal, the method of the invention containing an antigen to elicit a protective immune response in a subject against the antigens.

The antigen is from a pathogen such as virus, bacterium or protozoan, or

New IL-21 polypeptide and encoding polynucleotide, useful for diagnosing and treating disorders with aberrant expression or activity of the IL-21 polypeptide, such as cancer, rheumatoid arthritis, multiple sclerosis and diabetes.
from cancer or tumour cell antigen, or expressed on the surface of cancer cell. An alternative method of the invention is useful for modulating the activity of immune or haematopoietic cells and thus to treat or prevent a variety of immune disorders, such as autoimmune diseases, for example diabetes mellitus, multiple sclerois, myasthenia gravis, systemic lupus erythematous, dematitis, ulcer, asthma. allergic asthma, anaemia, hepatitis, Graves's disease, graft versus host disease, and scleroderma. The present sequence is used in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                    120
